Credit Name:
Assignment Name: Schoolinputer

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem
How did you approach understanding the challenge?
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?
For any problems I had, there was always a tiny aspect that I either forgot or needed to add. I think what confused me in this program was how to get the option selected in the ComboBox and output that to the user in a label. I overcame this problem by using --> String.valueOf(grade.getSelectedItem());
Planning the Solution
Did you create a plan or break the problem into smaller steps before coding?
How did you decide on the tools, data structures, or algorithms to use?
For this program, I had to be intentional with what I wanted my program to do. I created a little diagram for myself to understand all the components that I needed to include in my program which helped me decide specific tools.
Implementation
Did you write the code in small pieces or attempt the entire solution at once?
How did you test your solution along the way to make sure it was working?
I did this carefully in small pieces, breaking each programs function into different parts. So like getting the users inputs was part 1, displaying that part 2, and then associating each specific icon with its own if statement- part 3
Overcoming Challenges
What part of the problem was the most difficult for you?
How did you handle moments when you felt stuck or unsure of what to do next?
Similarly, the part that was most difficult was getting all the inputs together and being able to display them. If I felt stuck on any specific part, I made sure to ask questions, ask classmates and at times use AI to know where I went wrong and why I thought that would be right.
Learning
Was there anything you learned that you think will help you with future challenges?
I learned how to get the text or the option of the ComboBox without needing an extensive code and multiple variables.
