Credit Name:
Assignment Name: BreakAPlate

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem
How did you approach understanding the challenge?
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?
I believe this program was pretty straightforward. I did just have to think a bit when coding for the if statement of when the plates are not broken. I was just confused on how to get rid of any leftover prize images from the attempt before. I realized I just have to set the Icon to null.
Planning the Solution
Did you create a plan or break the problem into smaller steps before coding?
How did you decide on the tools, data structures, or algorithms to use?
I focussed on each if statement first very carefully and then once that was running, everything else was working fine. I took help on the notes that I made from the previous skillbuilders which helped me decide on what types of functions and when to use what.
Implementation
Did you write the code in small pieces or attempt the entire solution at once?
How did you test your solution along the way to make sure it was working?
For this program, I attempted everything all at once because I just found it easier trying to accomplish as much as I can first and then going in and prefecting the more specific things.
Overcoming Challenges
What part of the problem was the most difficult for you?
How did you handle moments when you felt stuck or unsure of what to do next?
I think I was fairly okay with this program. If I felt stuck on any specific part, I made sure to ask questions, ask classmates and at times use AI to know where I went wrong and why I thought that would be right.
Learning
Was there anything you learned that you think will help you with future challenges?
I think I better understood Icon functions so like how to imort images, how to set them onto labels and what to do to get rid of them.
